ABSOLUTE / UPAJ

Rural-credit risk, ULI and RiskStac product context

Agricultural risk signals and standardised lender handoffs, with RiskStac as a current public product reference.

Role: Product leadership across the Absolute portfolio | Period: October 2021–November 2024

Reported outcomes and scope

167 · Reported satellite indices

500K+ · Reported partner lending reach

Source wording varies between farmers and loans.

Under 30 min · Reported lending time

The original timing window is not supplied.

The product problem

Rural borrowers may have limited conventional credit history or formal income proof. Agricultural and geospatial information can contribute to assessment, but only when it can enter a lender’s decision process in a consistent, usable form.

My role

I led product work on agricultural risk assessment and the information-sharing workflow around it, collaborating with lender and data partners. The remit included the risk-product integration with public lending infrastructure and the institutional requirements around that handoff.

What I built

The risk capability uses agricultural and environmental signals, with 167 satellite indices reported in the Professional Profile. The relevant product work connects signal definitions, risk output and the information a lender needs.

Standardised APIs and ULI integration address a workflow bottleneck between data providers and lenders. International work with CRIF, Experian and Bank of Brazil is described separately from the Indian infrastructure.

Turning farm signals into lender information

My product work addressed an information gap: a functioning farm could have little bureau history, formal income evidence or consistent land records. The risk offering combined farm and environmental inputs rather than leaving the bank to assemble disconnected indicators. The Professional Profile names weather, soil moisture, vegetation, historical yield and parcel-level land-use signals.

I worked on the assessment capability and its standardised information-sharing integration. The product definition connected what the agricultural analysis could supply with what an institutional user needed for appraisal. The reported 167 satellite indices describe input scope; they are not an accuracy measure or proof that I personally coded the underlying models.

Product work at the institutional boundary

The integration moved the assessment from a separate agricultural tool towards information a lender could access in its own workflow. I led product work on the ULI risk solution, including the standardised API and information-sharing requirements described in the career record.

My ownership was the risk-information product and partner handoff. The lender retained credit approval and disbursement responsibility. The reported partner-enabled programme reach was more than 500,000 rural farmers or loans, with disbursement described as under 30 minutes. This is the wider lending result around the integration.

RiskStac: current product reference

Upaj’s RiskStac page, captured in October 2026, presents a farm-credit report, repayment-risk mitigation and farm-health monitoring. Its stated inputs include satellite, IoT, weather, climate and soil-health data. This current proposition gives a visual reference for the agricultural lending problem addressed by the historical work.

The 2026 public page describes monitoring through a loan’s life, including custom insurance and farm-progress dashboards. It is a current product reference, captured after my Absolute tenure, rather than a claim that I owned the present branding, every offered capability or the authenticated lender experience.

What changed

The partner-enabled programme reports reach of more than 500,000 rural farmers or loans in its first year and disbursement under 30 minutes. The product contribution was making additional agricultural risk information available within lender appraisal. The source notes preserve the count and clock-definition limits.

The lesson from this work

This case demonstrates translating domain data into an institutional workflow. The product boundary is the assessment capability and its lender handoff; underwriting decisions, national infrastructure and end-to-end bank operations remain separate responsibilities.

ULI: the public infrastructure reference

These recordings show ULI's public platform, updates and data-service catalogue. They explain the infrastructure context for the rural-credit work; RBIH's national platform is a separate institutional product.

Watch the current public product reference

These recordings capture Upaj's current public product information in October 2026. They provide visual context for the historical contributions described here; they do not establish ownership of every current feature.
