Adapting Upaj for Brazil and Malaysia

Localising language, data and institutional workflows while preserving a reusable platform.

Role: Product leadership across the Absolute portfolio | Period: October 2021–November 2024

Reported outcomes and scope

Brazil + Malaysia · Reported international deployments

Language · environment · regulation

Three documented dimensions of adaptation.

The product problem

An Indian product configuration does not carry unchanged into another market. Language, units, crop conditions, data availability and regulatory workflows affect both the experience and the risk information institutions can use.

My role

I led product work on international adaptation and institutional delivery, collaborating with regional teams and partners including Bank of Brazil and Experian. The remit also included credit-data collaboration with CRIF.

What I built

The documented adaptation includes Portuguese and Bahasa Malaysia, local weather and soil information, unit conversion and regulatory requirements. Local credit assumptions had to fit the available data.

The institutional work involved integration and technical due diligence rather than only translating interface text. The same risk primitives were adapted to different environmental and financial contexts.

Localising the product assumptions

I worked on language and the information layer together: Portuguese for Brazil, Bahasa Malaysia, unit conversions, country-specific weather and soil inputs, and financial and agricultural regulatory requirements. Translation was one part of a product configuration that needed to fit the environment and institutional workflow.

The same agricultural-risk primitives had to work with locally available evidence. The project included custom-score collaboration with CRIF in India and Experian in Brazil. That partner work connected agricultural-data expertise with established credit-data services, while local requirements shaped the configuration being delivered.

Working through an institutional deployment

The institutional account includes procurement, technical due diligence and integration work across Brazil and Malaysia. Bank of Brazil and Experian are named in both the early CV and the later Professional Profile. My product contribution connects local requirements with the engineering and data work needed for deployment.

This expanded the product remit beyond an Indian consumer interface. Local teams and institutional partners needed a system they could use in their own setting. The case reports deployment and partner onboarding, without translating those milestones into an undisclosed regional revenue, adoption or underwriting-quality result.

What changed

The January 2025 CV and Professional Profile report deployment in Brazil and Malaysia and onboarding institutions including Bank of Brazil and Experian. They do not provide a separate regional adoption or revenue result.

The lesson from this work

This case demonstrates platform reuse with local judgement. The reusable component does not remove the need to understand local data, institutional expectations and the decisions the product supports.

Visual references and walkthroughs

Documented workflow: Local farm and lender needs → Portuguese / Bahasa interfaces → Weather, soil and units → Environmental and credit workflows → Regional partner delivery

An authored explanation of the workflow described in this case study. This is a diagram, not a captured product screen.

Evidence and attribution

Institution names and deployments are reported in supplied career records; no isolated regional revenue is claimed.

Named partners and deployments are self-reported. Market-by-module scope, pilot-versus-paid-production status, contract values and regional adoption are not supplied.
