CASHKARO / BANKKARO

Reusable lender integrations and lending operations

Connecting eligibility, KYC, application status and payouts through a common contract and a measurable operating process.

Role: Lending product and business owner | Period: March 2025–Present

Reported outcomes and scope

20+ · Reported lending partner panel

Eligibility · KYC · status · payouts

The documented integration contract covers these four recurring partner concerns.

The product problem

A growing lender panel can create repeated engineering work and inconsistent operations. Each partner has its own eligibility, documents, status updates and payout rules. The customer experiences those differences as delays or uncertainty unless the integration and operating process work together.

My role

I worked on the lender-integration requirements and the partner reporting and review process, alongside engineering, lender teams and operations. The contribution includes the common contract and the business controls around it.

What I built

The documented contract normalises eligibility, KYC handoff, application status and payouts while preserving lender-specific requirements. Common borrower inputs are carried through configurable partner behaviour.

MIS links lender funnel performance with service levels, payout reconciliation and dispute tracking. Reporting is useful here because an application outcome also creates an operational and commercial follow-through task.

Making the common steps explicit

I identified the recurring elements of a lender connection: eligibility, KYC handoff, application status and payout information. The API-first design normalised those shared needs so a new partner could fit a common structure while retaining its own policy. I worked directly with engineering on the modular lending stack and the partner reporting around it.

The product and commercial conversations happened together. Payout structure, KYC responsibility and service levels had to be workable for both organisations. Rejection reasons also mattered because an unsuccessful application could reveal a routing issue. This made onboarding a combination of integration requirements, partner commitments and a repeatable operating process.

Building an operating team around the integration

I recruited across product, sales and operations as the lending business grew from its initial team. Building that cross-functional capability was part of making the marketplace operate after launch. The team's work connected lender integration with customer applications and day-to-day follow-through.

The daily MIS joined lender-wise funnel performance, partner service-level tracking, disputes and payout reconciliation. An application's outcome had to be reflected in the business record, and an unresolved dispute needed visibility. The review cadence brought those questions back to lender conversations and product priorities, instead of ending ownership when a request was handed off.

What changed

The wider lending business reports a panel of more than 20 banks and NBFCs. The integration and MIS work gave the team a common way to follow lender performance, application status, service risks and payout follow-through. It connected the reusable integration structure with the partner and operations work needed to run it.

The lesson from this work

This is platform work at the boundary between software and partner operations. The reusable capability is the shared contract; the operating discipline is knowing what happened to each application and whether its outcome was reflected in the business records.

Visual references and walkthroughs

Documented workflow: Partner commercial and policy contract → Normalised eligibility and KYC → Application-status exchange → Payout and reconciliation → MIS and partner review

An authored explanation of the workflow described in this case study. This is a diagram, not a captured product screen.

Evidence and attribution

The partner panel spans lending; it is distinct from eight configurations in the EduLoans rule model.

Hiring and cross-functional leadership are reported; direct reports, headcount and coaching episodes are not supplied. Configuration-based onboarding is described as the design approach, with no independent integration-time benchmark.
