CASHKARO / BANKKARO

# A personal-loan marketplace built around lender fit

A common application and lender-routing journey, backed by partner operations and stage-level measurement.

Role: Lending product and business owner | Period: March 2025–Present

## Reported outcomes and scope

16% → 45% · Reported funnel conversion

The event definitions and comparison cohorts are not included in the supplied records.

20+ · Banks and NBFCs

Reported panel across lending.

## The product problem

CashKaro had an established distribution audience, while a lending application still had to satisfy different lenders' eligibility, KYC and servicing requirements. A customer could complete a form and still be sent towards an unsuitable lender. The product problem included the handoff and the operating process around the application.

## My role

I owned the application experience, partner commercials, lending operations and P&L. I built the marketplace alongside bank and NBFC onboarding, working with engineering on the lending journey and with growth on distribution through CashKaro's existing rewards surfaces.

## What I built

The application used common borrower inputs and eligibility-based lender routing. Partner onboarding ran alongside product delivery, covering payout structures, KYC handoffs, service levels and rejection feedback.

Stage-level funnel data, lender MIS and weekly reviews connected observed drop-offs to changes in the application and follow-up process. Reconciliation and dispute tracking made the lender relationship part of the product's operating system.

## One application, different lender requirements

I designed a common application so an applicant did not have to understand every lender’s policy before starting. Routing used income band, bureau score, employment type and geography to compare the applicant with lender eligibility. The aim was to make lender fit part of the journey before the customer spent time on an unsuitable application.

I ran commercial onboarding in parallel with the reported 30-day build. Each lender conversation covered the payout structure, KYC handoff, service-level expectations and rejection feedback. These details affected the customer journey: a usable form still needed an agreed destination for the case and a way to learn what happened afterwards.

## A weekly rhythm for improving the funnel

I built reporting around lender performance and the stages a case passed through. A daily operations view connected application progress with service levels, payout reconciliation and unresolved disputes. Weekly reviews then followed a practical sequence: pull stage-level drop-offs, form a possible explanation, ship a change and measure what followed.

This also connected product work to commercial accountability. Loan volume, partner payouts and the cost of processing a case sit in the same business, so I owned the P&L alongside the journey. Partner reporting and commercial terms were therefore part of product ownership, and helped bring the customer and business views into the same operating review.

## What changed

The programme reports funnel conversion moving from 16% to 45%, a 29 percentage-point improvement. More than 20 banks and NBFCs formed the broader lending panel. These results describe the marketplace programme, combining routing, partner onboarding, operational follow-through and repeated funnel changes.

## The lesson from this work

This case connects customer experience with partner policy and operating economics. Its useful product pattern is a shared application with configurable lender differences, supported by measurement that shows where an application loses momentum.

## Visual references and walkthroughs

Documented workflow: Customer lending intent → Common application → Eligibility-based routing → Bank / NBFC review → Status, payouts and feedback

An authored explanation of the workflow described in this case study. This is a diagram, not a captured product screen.
