CREDFLOW

Taking KuberX from a built app to a measurable launch

SME acquisition and activation connected to the economics of a payments and lending product.

Role: Senior Product Manager | Period: December 2024–March 2025

Reported outcomes and scope

−45% · Reported first-month CAC change

□10L · Reported acquisition-cost savings

The original spend and cohort records are not included.

The product problem

KuberX needed users who could discover the app, complete onboarding and reach a useful payment or lending action. Acquisition spending was hard to improve without a consistent view of what happened after a person arrived.

My role

My remit covered the launch journey, lending analytics, credit-card payments and P&L. I introduced app analytics and MoEngage and worked with growth and engineering to connect acquisition, onboarding and activation.

What I built

The programme added an event structure across acquisition and activation. Targeted sign-up events and onboarding changes were used to improve the cost of acquiring SME users.

The useful measurement question is whether an acquired user reaches a valuable action. Sign-up volume, CAC and subsequent product use therefore belong in the same launch review, rather than treating release as the finish line.

Making acquisition and activation visible

I introduced MoEngage and app analytics to give the team a view of what an SME user did after arriving. The event structure covered acquisition and activation rather than only the first sign-up. This gave product and growth a shared foundation for discussing where the launch journey lost momentum and which onboarding or acquisition changes to make.

I used targeted sign-up events and onboarding changes as part of that programme, including gamified acquisition and personalised SME journeys described in the launch account. These changes were coordinated across product, growth and engineering. The launch connected new-user acquisition with the product steps that could turn a sign-up into useful activity.

Bringing the workstreams into one launch

My scope included the launch journey and KuberX P&L. Analytics, acquisition, onboarding and the payment feature had to reach use together: an acquired customer needed somewhere useful to go after joining. I collaborated with engineering on the Pay via Credit Card solution while improving the funnel around it.

The CredFlow role covered a concentrated launch period, from December 2024 to March 2025. The work combined the measurement foundation with changes to acquisition and activation. CAC and payment value then gave different views of the early result: the cost of bringing users in, and the business action those users could take.

What changed

The launch programme reports a 45% CAC reduction within its first month and □10 lakh in acquisition-cost savings. The Pay via Credit Card launch, covered separately, reports □10 crore in first-week transaction value. Together they describe acquisition efficiency and transaction activation during a concentrated launch period.

The lesson from this work

The case demonstrates a launch that joins delivery with behaviour and commercial measurement. Instrumentation gives the team a way to diagnose a problem; the actual improvement comes from the combined programme of acquisition and product changes.

Visual references and walkthroughs

Documented workflow: Acquisition instrumentation → First meaningful app action → Activation and cohort analysis → Targeted onboarding journeys → Acquisition economics review

An authored explanation of the workflow described in this case study. This is a diagram, not a captured product screen.
