INDEPENDENT PRODUCT STRATEGY

MoneyLion WOW: a strategy and retention exercise

Independent proposals exploring recurring member value, product integration, credit utility and measurable retention.

Role: Independent strategy author | Period: Portfolio exercise

Reported outcomes and scope

Strategy + prototype flows

Independent proposal deliverables, rather than shipped MoneyLion features.

BUR90 retention definition

A proposed cohort measure of repeated qualifying benefit use.

Pilot and sensitivity model

Assumptions and scenarios intended for validation.

The product problem

The supplied exercise asks how a paid membership can provide recurring value after an immediate liquidity need has passed. Earlier material frames this as a fragmented ecosystem and proposes a Credit Cockpit; later material explores credit utility and merchant-funded benefits.

My role

I authored strategy presentations and a cohort-retention diagnostic. This is an independent portfolio exercise, not MoneyLion employment, a commissioned client engagement or evidence of a launched MoneyLion product.

What I built

The Credit Cockpit version proposes linking financial-product surfaces, secured-credit utility and proactive credit-management features. These are proposals whose technical, partner and regulatory feasibility would need validation.

The later 60-slide work develops merchant-funded cashback, cash-flow-based lender matching, a visible membership ROI dashboard and a staged pilot. It distinguishes settled rewards from estimates, keeps merchant spend separate from membership acquisition cost and describes outcome and contribution

guardrails.

The retention diagnostic focuses on repeated use rather than launch sign-ups. Bounty Utilization Rate is defined as the share of a paid-start cohort completing at least two qualifying transactions within 90 days. The sample curves and financial scenarios illustrate the method; they are not observed MoneyLion results.

• Evaluate repeated member value rather than sign-up volume alone.

• Keep estimated benefit separate from realised, settled member value.

• Connect customer outcomes, credit quality and contribution before scaling.

• Treat partner and regulatory feasibility as validation work, rather than a completed launch claim.

A cohort contract for recurring value

The later proposal defines BUR90 around every first-time paid WOW start whose cohort has reached day 90. The numerator is members completing at least two distinct qualifying D2C Mega-Cashback transactions, with purchase and settlement by day 90. Cancelled, refunded and inactive starts remain in the denominator; referrals, reversals and split-order duplicates do not count as qualifying transactions.

The proposed measurement records offer version, settlement time and reversal status. D7 profile activation, a D30 first settled reward and D60 second-order progression serve as leading signals, while pending rewards stay separate. This makes the repeat-use question more precise than a launch-sign-up count or a chart of active members alone.

A proposed pilot, with explicit assumptions

The latest 60-slide deck proposes two main bets: merchant-funded CPA cashback passed through to members, and cash-flow-first lender-approved matching. Fee-free Instacash utility and a membership ROI dashboard support those bets. The execution proposal starts with consent, data quality, quote contracts and funded merchant supply before scaling referrals, personalisation and lifecycle prompts.

Every number here is a planning assumption from the exercise. The initial pilot proposes ten merchant partners, 25 by month three and 50 by month four. Proposed gates include a D30 first-bounty rate of at least 40%, at least 99% correct settlement, and BUR90 of at least 60% with a ten percentage-point lift over generic ranking. A six-month plan assumes twelve core roles plus shared Risk/Finance support and an illustrative $980,000 budget. None is an achieved MoneyLion result.

Scale, repair or stop based on the mechanism

The proposal assigns failure responses to the underlying constraint: repair data coverage or lender fit, fix reward tracking and merchant supply, simplify ranking if a holdout shows no incremental value, or stop acquisition when economics fail. Earned rewards remain protected. Permissioned messaging and referral caps are proposed safeguards rather than evidence of a launched policy.

The earlier Credit Cockpit decks explore a different route through credit utilisation, secured-credit utility and a data/dispute centre. The retention diagnostic and later deck are separate iterations of the exercise. The deliverable is a set of inspectable bets, flows, economic assumptions and experiments, with partner, risk and commercial validation still required.

What changed

The outputs are strategy documents, product-flow concepts, a proposed experimentation plan and an economic model. No delivered conversion, credit-score, retention or contribution-margin improvement is claimed. Older and later deck versions contain different bets and assumptions, which remain versions of the exercise rather than one implemented programme.

The lesson from this work

This case demonstrates product reasoning that connects user value, business economics and a testable measurement contract. The strength of the exercise is making the proposed mechanism and validation plan inspectable, while keeping an illustrative model separate from a business result.

Evidence and attribution

Independent strategy exercise; no MoneyLion employment or client relationship is claimed.

All example financial values, retention curves and pilot targets are proposals or assumptions, not measured MoneyLion outcomes.

Latest 60-slide proposal: slide 24 defines BUR90; slide 25 lists proposed 40% D30/60% BUR90 gates; slides 56–57 show the six-month roadmap, assumed roles and illustrative $980,000 pilot envelope. All targets and financial values are assumptions. Earlier decks contain different bets.
