RBIH / UNIFIED LENDING INTERFACE

Lending, as infrastructure

Unified Lending Interface. A detailed visual and source reference for Priyam Sameer's product portfolio, preserving the requested RBIH page and its wider lending ecosystem.

Original RBIH website capture. The companion archive preserves the full page and individual content views.

THE RECORD

Requested source: RBIH's ULI “What's New” page. **Archive date:** 13 October 2026. **Reference scope:** its six update cards, the public platform proposition, selected official technical documentation, and dated RBI / Government releases.

WHY THIS BELONGS IN A PORTFOLIO

ULI provides context for work in lender integrations, agricultural data, consent-based data access and credit workflows. This pack helps explain the surrounding infrastructure using official sources and preserved visuals.

Attribution boundary: RBIH owns and publishes these sources. They establish the public ecosystem context; Priyam's individual contribution, systems shipped and outcomes require his own project evidence.

What was preserved

The requested page is an ecosystem update board. It describes integrations and a pilot; it is not a borrower application, underwriting dashboard or authenticated operating console.

Layer	Evidence captured / read	What the evidence supports
Requested public page	Six cards, card anchors, visible text, page layout and public navigation. [S01]	The integrations and status claims published by RBIH at capture time.
Platform context	ULI proposition, public journey, service categories, providers and displayed platform counts. [S02]	The website's presentation of the platform, not independently measured adoption or latency.
Technical context	Selected public RBIH onboarding, AA consent, dairy consent and land-records documents. [S05-S08]	The documented contract or flow for those specific services.
Historical context	RBI pilot announcement and annual report; government adoption meeting. [S03-S04, S09]	Dated events and explicitly dated counts.
Companion media	Screenshots, original image assets, short visual videos and source manifests.	Reusable visual evidence with source relationships; videos are archival presentations.

PUBLIC INTERFACE FLOW

Open “What's New” > read the six update cards > use the card anchor to retain a specific update > return to the ULI platform page through the back arrow > explore the platform proposition and documentation. This is a content-navigation flow, distinct from a loan transaction.

SCOPE LIMIT

No borrower details, credentials or OTPs were entered. No lender onboarding, subscriptions, API requests, credit applications, consent requests or operational transactions were performed. Documented flows later in this report are explanations of public sources.

Source IDs such as [S01] refer to the linked bibliography on page 16. A capture date indicates when material was read; it does not supply a missing publication or integration date.

Updates: credit and dairy

The first three cards describe a post-loan service, bureau connectivity and dairy cash-flow data. Each is preserved with its own source anchor and evidence boundary.

Card / date	Published development	Product implication and limits
01 / 1 March 2026 pilot start	MoRTH vehicle hypothecation termination: a lender-to-ULI-to-MoRTH API-led flow following loan closure. The card says the pilot is live with six lenders. [S01#wn-1]	Moves a vehicle-lien removal step away from fragmented manual RTO procedures. The page claims faster, consent-based termination; no completed transaction or measured turnaround was observed.
02 / undated	All four CICs are listed as live: Equifax, CIBIL, CRIF High Mark and Experian. The card describes consent-based access to verified consumer credit data. [S01#wn-2]	Integrates bureau information into appraisal and risk assessment. The card does not publish bureau-specific payloads, scoring models, commercial terms or approval uplift.
03 / undated	Kamdhenu, the Himachal Pradesh Milk Federation, and Aavin, the Tamil Nadu Milk Federation, are listed as live for milk-pouring and related cash-flow information. [S01#wn-3]	Adds sector-specific alternative data for dairy underwriting and monitoring. This is a capability description, not a validated effect on defaults or disbursement.

INTERPRETATION FOR PRODUCT WORK

The cards cover three different stages of lending: risk appraisal, sector-specific underwriting / monitoring, and servicing after repayment. A portfolio should keep these stages distinct rather than describing all integrations as “loan origination”.

DATE DISCIPLINE

The MoRTH card contains an explicit pilot date. The bureau and dairy cards do not expose publication dates in the captured text. Their order on the page is not a reliable chronology.

Permalinks: append #wn-1, #wn-2 or #wn-3 to the requested page URL. These anchors identify cards; they do not create separately dated announcements.

Vehicle Hypothecation Termination pilot through ULI in collaboration with MoRTH

Original heading of the MoRTH pilot card. Full readable captures are retained in the archive. [S01]

RBIH / UNIFIED LENDING INTERFACE

Updates: inclusive agri-credit

The remaining cards connect verified rural data, cooperative credit infrastructure and state land records. The text includes stated benefits that need to be kept separate from measured results.

Card / date	Published development	Workflow relevance
04 / undated	Ministry of Rural Development NRLM: consent-based access to verified Self-Help Group and member information. [S01#wn-4]	Borrower identification and assessment, less manual processing, and potential straight-through loan processing. These are published intended benefits, not observed STP rates.
05 / undated	NABARD e-KCC and CDCI platforms: integrated with ULI; Regional Rural Banks and District Central Cooperative Banks are described as able to process and disburse through ULI services. [S01#wn-5]	Institutional access for agriculture and related credit. The card does not establish that every RRB or DCCB is live, or specify which lender products are operational.
06 / undated	Land-records services across 11 named states: ownership, parcel, mortgage and court-case information through standardized APIs. [S01#wn-6]	Digital verification for KCC and agricultural lending, with lower dependence on physical documents. Field availability and quality may remain source-specific; no production request was tested.

THE 11 STATES NAMED IN THE CARD

Madhya Pradesh; Uttar Pradesh; Maharashtra; Tamil Nadu; Andhra Pradesh; Odisha; Tripura; Chhattisgarh; Assam; Gujarat; Karnataka. This list is the requested page's statement, preserved as a snapshot. [S01]

STATE COVERAGE, BY SOURCE

The requested card names 11 states. The captured catalog's ownership row also names Rajasthan and Himachal Pradesh, giving 13 provider-state names; the dated dashboard likewise shows 13. The next-gen document lists 12 backends. No addition dates or common rollout definition are supplied, so these source scopes remain separate. [S01-S02, S08]

Permalinks: #wn-4, #wn-5 and #wn-6. “Integrated”, “live”, “able to process” and “will support” convey different levels of certainty and should retain those distinctions in portfolio captions.

What ULI is designed to solve

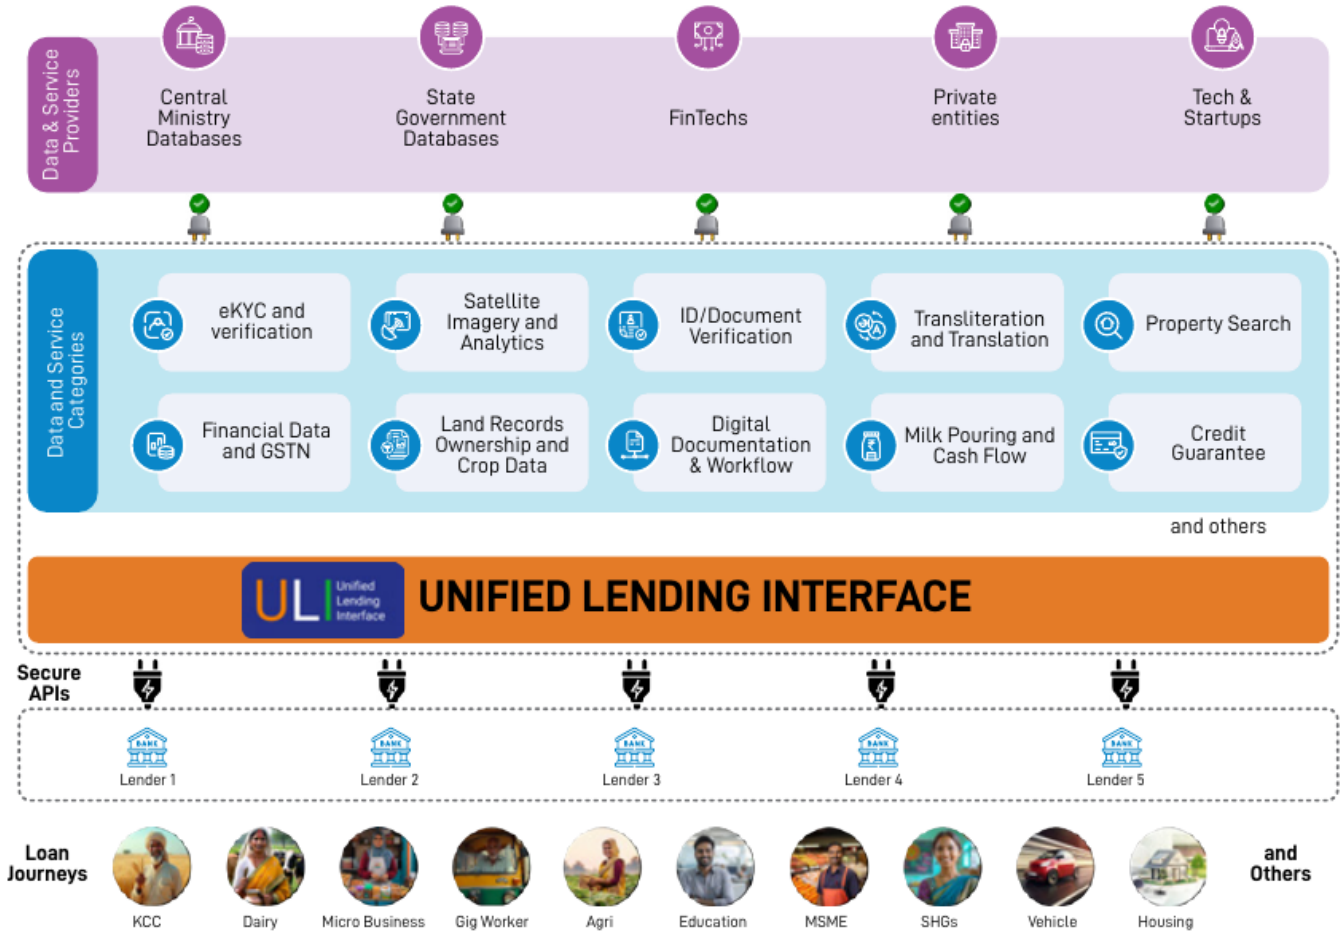

The core proposition is to make the information needed for credit easier to obtain through a common technical platform, reducing fragmented lender-to-provider integrations.

THE ORIGINAL PROBLEM

RBI's pilot announcement describes friction from information being held across central and state governments, Account Aggregators, banks, credit-information companies and digital identity authorities. Separate technical integrations can make those datasets difficult to use together in lending. [S03]

THE PLATFORM RESPONSE

The platform is described as open, with an open-API and standards-based approach that allows financial-sector participants to connect through a plug-and-play model. RBI's annual report states that ULI removes the need for lenders to make multiple bilateral integrations. [S03-S04]

Original ecosystem graphic from RBIH Annual Report 2024-25, page 12. Historical published model; not proof that every depicted journey was live or fully digital. [S18]

Historical naming: Public Tech Platform for Frictionless Credit (PTPFC) in 2023; renamed Unified Lending Interface on 26 August 2024 according to RBI's annual report. [S04]

Actors and responsibilities

A relationship map derived from public descriptions. The platform connects lender demand with data and service providers; it does not itself establish who owns a particular lender's credit decision.

Actor	Publicly described role	Boundary for a case study
Borrower / farmer / SHG member	Provides data access or participates in an applicable consent flow; supplies identifiers required by the service. [S06-S07]	Borrower experience, eligibility and consent comprehension need borrower-specific evidence.
Lender / financial information user	Requests information or services as part of its own credit workflow; applies eligibility policy and grants the loan. [S10]	A named lender partnership or integration should be supported by project records.
ULI / RBIH	Common connection layer and service access developed through RBIH; RBIH is a wholly owned RBI subsidiary. [S03, S05]	The archive is not evidence that Priyam built or owned ULI.
Data / service provider	Supplies particular information or an operation. Multiple providers may serve one service. [S10]	Provider listing alone does not establish data quality, contract access or production use by a specific team.
AA / financial information provider	The AA consent document describes the FIU, AA intermediary and FIP relationship. [S06]	Requesting consent does not equal consent approval or successful data delivery.
MoRTH / RTO ecosystem	The hypothecation pilot links lender closure workflows to MoRTH. [S01#wn-1]	No RTO-specific operation, fallback or final termination evidence is included.

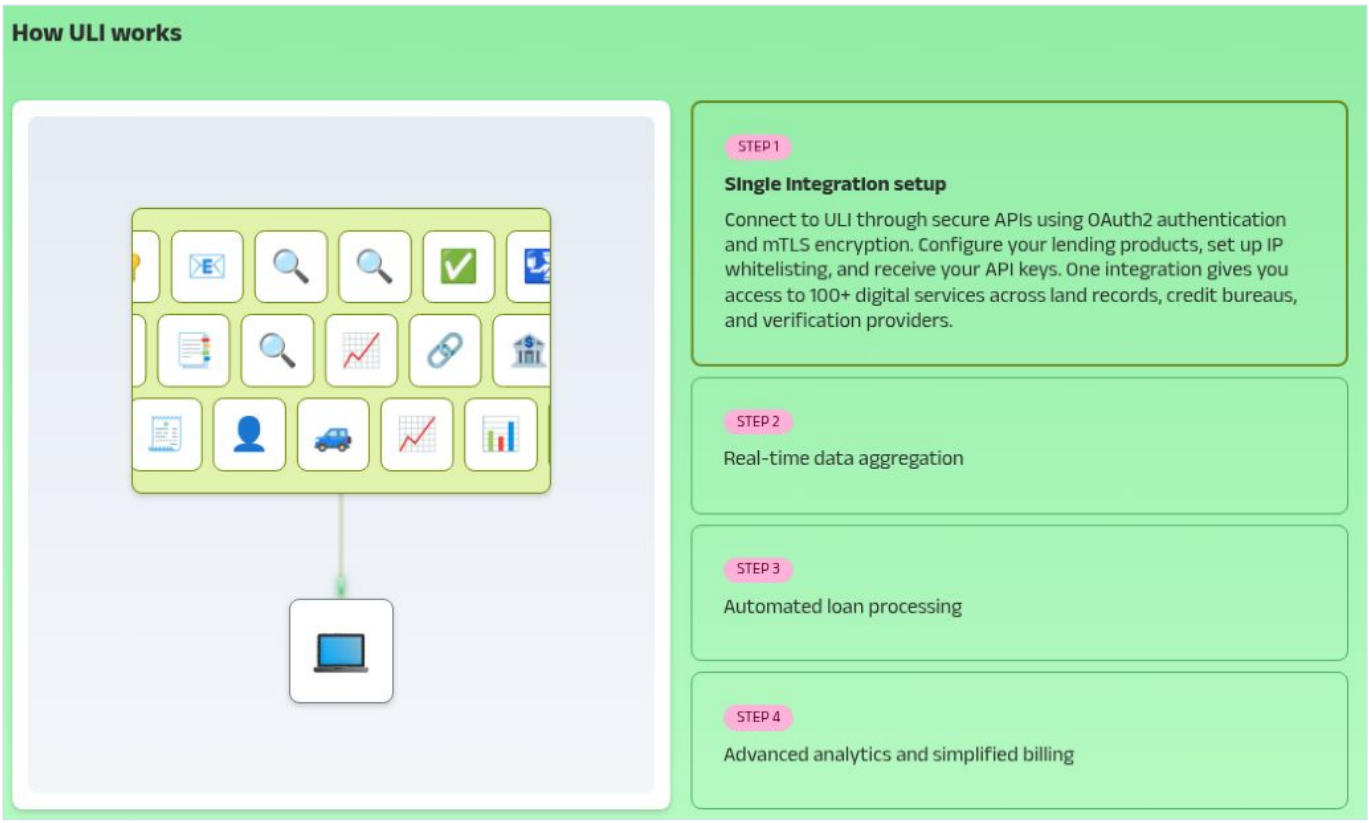

RELATIONSHIP MODEL

Lender workflow > ULI service interface > relevant data / execution provider. An applicable consent process surrounds access to borrower-linked data. Results then return into the lender's own workflow. This is a conceptual relationship model from the sources, not a universal API sequence.

Account Aggregator, bureau, dairy and land-records services differ in contracts and interaction patterns. A single diagram should not imply that every service uses the same consent artifact, callback or polling mechanism.

The published lending journey

RBIH's platform page presents four stages, from connection to usage and billing. The original interface is preserved below; service-specific documentation adds the detailed behavior.

Original “How ULI works” interface, Step 1 selected. Each stage is a clickable panel on the public platform page. [S02]

Published stage	Page-described function
01 / Integration	Common API connection, lending-product setup, credentials and whitelisting.
02 / Aggregation	Retrieve source information such as land, bureau and AA data through common access.
03 / Processing	Use returned evidence in the lending system; applicable agreement and execution services.
04 / Usage and billing	Usage dashboards, metered calls and consumption-based monthly invoicing.

Published proposition [S02], not an executed loan. The broad speed statement should be read alongside service-specific asynchronous documentation. No universal SLA, automatic approval or commercial term was independently verified.

Consent: two distinct patterns

The official support pages make two consent mechanisms concrete. Neither should be generalized to every ULI data service.

ACCOUNT AGGREGATOR / PERFIOS DOCUMENT

An onboarded lender / FIU submits a provider-compatible AA consent request using the ReBIT FIU 2.0 structure. The AA mediates access to FIP-held information. The documented request returns a ConsentHandle for later status handling; ULI relays the AA payload. A successful request is not proof of consent approval or data retrieval. [S06]

Step	Documented intent	Meaning for a product workflow
1. Initiate	Prepare an appropriate consent request through the AA service.	The purpose, data scope and participating accounts require the correct service contract.
2. Identify request	Receive a ConsentHandle associated with the request.	Persist the consent reference so the borrower journey and downstream state can be related. This persistence guidance is a portfolio interpretation.
3. Resolve status	Use the consent reference in the documented subsequent status process.	A request response alone does not prove that the customer approved consent.
4. Retrieve / use data	Separate subsequent data operations depend on the consent outcome and service workflow.	Do not portray consent creation as evidence that financial information was successfully obtained.

DAIRY / DGV-AMUL DOCUMENT

The DGV / Amul consent guide requires farmer / provider identifiers and an OTP sent to the registered mobile. It specifies a ten-minute lifetime and up to three generation and three verification retries. Successful consent returns transaction identifiers for later insights retrieval. [S07]

FROM CONSENT TO USEFUL EVIDENCE

Separate documentation describes monthly milk-volume / income indicators, longer-period income aggregates and consistency or gaps in milk pouring. Another service returns a PDF report after consent. These outputs can inform a lender assessment; they do not themselves approve a loan. [S11-S12]

KEEP THE PROVIDERS DISTINCT

The requested update card names Kamdhenu and Aavin. The selected technical OTP document is for DGV / Amul. It demonstrates one publicly documented dairy-consent pattern; it does not establish that Kamdhenu and Aavin implement the same payloads or limits.

Provider-specific references, not live consent recordings. No OTP, farmer data or PDF was requested.

Land records: an async workflow

The selected next-gen documentation describes a unified land-records service across state backends. Its explicit state model is more useful than a generic promise of instant retrieval.

Stage / state	Documented behavior	Product handling
Submit / RECEIVED	HTTP 202 returns request_id. The getting-started guide recommends polling every 1-2 seconds. [S13]	Acknowledge work and preserve its reference; do not treat acceptance as completed verification.
Intermediate work	PREPARING: resolve location codes. VALIDATING: provider checks. EXECUTING: source request. TRANSFORMING: normalize / transliterate. SIGNING: integrity signature. [S14]	Present meaningful status while the work progresses. These are documented states, not measured durations.
Terminal outcome	COMPLETED or FAILED. A status response can be HTTP 200 even when its body reports failure. [S13-S14]	Inspect the payload status and handle successful output separately from a failed job.
Network retries	The pipeline describes an idempotency key; a duplicate key can return LRS-1001 with the existing request_id. [S14]	Describe duplicate handling only for this documented service; do not infer a universal ULI scheme.
Result	Owner / parcel, area, crop and encumbrance-related evidence are described. [S08]	Check which fields exist and how the lender interprets them for the selected source.

PRODUCT QUESTIONS THIS MAKES CONCRETE

How is request status displayed? When does a lender proceed or wait? What happens if a state source returns incomplete data? How are parcel identifiers reconciled with borrower records? What qualifies a request as recoverable? These are case-study prompts derived from the state model, not claims about a shipped implementation.

SOURCE COVERAGE IS VERSIONED

The API reference describes staging and has differing host / route examples from the getting-started guide. Its introduction says 11 backends while listing 12 codes. The overview lists 12 states; the platform catalog lists 13. These scope / version differences require clarification before implementation. [S08, S13, S15]

The guide describes a typical 2-8-second completion; that is published documentation, not a live benchmark. This next-gen service is not proof of production rollout in every listed state. [S13]

API access and operations

The public Getting Started guide describes a controlled integration setup for onboarded lenders. This is a technical reference, not evidence that a particular organization has completed the setup.

Setup requirement	Public guide statement	Portfolio evidence to add
Onboarding	API access is directed to onboarded lenders. [S05]	Which institution / product was onboarded, when, and under whose access approval.
Environment	Sandbox and Production use separate subscriptions. [S05]	Which test environment was used and what production-release evidence exists.
Connectivity	The guide describes two-sided IP / URL whitelisting. [S05]	Validated network setup, service access and callback / endpoint configuration where applicable.
Credentials	Integration uses the assigned credentials for API access. [S05]	A redacted access model and ownership; never expose a key, token or password.
Authentication	The guide describes a JWT with a six-hour validity period. [S05]	How token expiry, refresh and failure are handled in the actual integration.
Service contract	Read the relevant provider-specific documentation. [S05-S08]	Request / response mapping, business rules and accepted evidence per service.

WHAT THE PUBLIC SOURCES DO NOT ESTABLISH

They do not establish Priyam's access, delivery ownership, endpoint implementation, production incident handling, decision policy, service-level agreements, model performance or the percentage of a funnel completed automatically. Those need records from the project team.

TECHNICAL LANGUAGE THAT IS SUPPORTED

Common access layer; open and standardized APIs; service-specific consent; separate environments; token-based access; asynchronous status handling for the documented land service. Describe each at the scope supported by its source.

Do not infer a universal event bus, idempotency scheme, data warehouse, scoring engine, queue topology, model pipeline or security certification from the public marketing page. These may be relevant design questions, but they are not verified implementation details here.

Data and service map

The captured public service catalog contains six categories and 128 labeled service rows. The complete saved JSON retains each service and its listed providers.

Public category / rows	Selected catalog examples	How the category can matter
Identity verification / 52	PAN; bank validation; Aadhaar e-KYC; name / face / address matching.	Resolve identity and account mismatches early. Which evidence is accepted remains a lender / service decision.
Asset verification / 30	Land ownership; master location data; khasra search; flag marking; charge creation.	Make parcel / asset evidence usable at verification and security-related stages.
Credit verification / 18	AML screening; bureau-related information; CGTMSE eligibility, guarantee and enquiry services.	Combine borrower and guarantee evidence at the relevant policy step.
Document execution / 2	e-Sign: Protean, NeSL, Leegality, Signdesk. e-Stamp: NeSL, Leegality, Signdesk.	Separate preparation, customer execution and confirmation in a case-study journey.
Income verification / 23	Bank statements; ITR / 26AS; GST; farm-yield report; milk-related insights.	Show which signal was supplied and how it affected the lender assessment.
Value added services / 3	Cheque OCR; document classifier; transliteration.	Handle document extraction / routing and language differences.

PROVIDER ≠ SERVICE ≠ LENDER

The extraction contains **55 distinct provider names** and **190 service-provider links**. These are counts of saved catalog definitions. The dashboard separately reports 143 live services and 64 live providers. The website does not disclose a counting rule that reconciles these numbers. [S02]

Catalog source: the official platform page's publicly loaded service mapping, captured 13 October 2026. For exact names, ordering and provider arrays, use source/service-catalog.json. A listing is not a runtime API schema or proof of a particular lender's usage.

Milestones, with dates

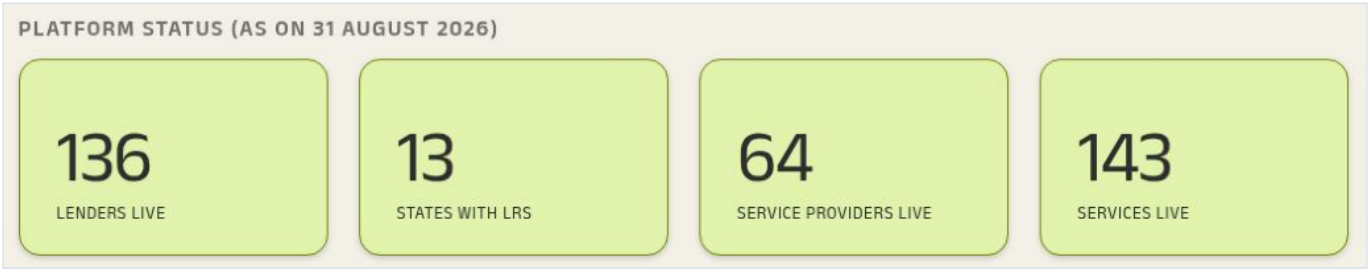

A dated chronology from primary sources. Undated update cards are kept outside the timeline except for the MoRTH card's explicit pilot start.

Event / reporting date	Primary-source milestone	Qualification
10 August 2023	Development of the Public Tech Platform announced in RBI policy statements. [S16]	Announcement date; not the pilot start.
14 August 2023	RBI publishes the pilot announcement and describes the platform's open-API / standards approach. [S03]	Publication date of the launch-specific release.
17 August 2023	Pilot commences, confirmed by RBI's annual report. [S03-S04]	Pilot commencement date.
26 August 2024	The Governor proposes the ULI name; the annual report confirms the renaming date. [S17, S04]	Original RBI speech and annual report used for the event date.
31 March 2025	Dated pilot snapshot: 44 lenders, more than 60 data services, 12 loan journeys. [S04]	Observation / reporting period end, not publication date.
29 May 2025	RBI Annual Report 2024-25 published. [S04]	The report publishes the 31 March snapshot retrospectively.
23 June 2025	Government release on a financial-services meeting discussing ULI adoption. [S09]	Release date; no separately established meeting date is assigned here.
1 March 2026	Vehicle hypothecation termination pilot is described as live with six lenders. [S01#wn-1]	Explicit date inside an otherwise undated update card.
31 August 2026	Platform dashboard reports cumulative status as of this date and monthly activity for August. [S02]	Reporting date; preserved in this archive on 13 October.

A precursor paperless KCC pilot began in September 2022. It is distinct from the broader platform pilot launched in August 2023. [S16] The undated update cards are not assigned inferred release dates. RBIH newsletter and BIS metadata have differing 2024 announcement dates; the original RBI speech is used here.

Scale: compare the right units

Preserve each number with its source, unit and time basis. The current website display and a dated historical report are different evidence types.

RBIH's status panel as at 31 August 2026. Original website capture preserved 13 October 2026. [S02]

Source / time basis	Published number	Interpretation
RBI Annual Report / as at 31 March 2025	44 lenders; more than 60 data services; 12 loan journeys. [S04]	Historical pilot snapshot. Lenders include banks and NBFCs. The report is dated 29 May 2025.
What's New / undated land card	11 states named for land records. [S01#wn-6]	Named integration statement on a different page. It is retained separately from the platform count.
Land-records docs / read 13 October 2026	12 state backends described. [S08]	Scope of the selected technical document, not an independently reconciled ecosystem total.
What's New / pilot from 1 March 2026	Six lenders in the vehicle-hypothecation pilot. [S01#wn-1]	A service-specific pilot population. It is not the total number of ULI lenders.

MONTHLY ACTIVITY IS A DIFFERENT UNIT

For August 2026 the dashboard displays 2.50 crore API requests, 31.8 peak TPS, 12.19 average TPS, 100% availability and zero unplanned-downtime hours. These are reported platform activity figures, not unique borrowers, loans, sanctions or disbursements. [S02]

WHAT THIS PACK DOES NOT CLAIM

No percentage growth calculation, national market share, disbursement impact, credit-risk reduction or Priyam-attributed scale is derived from these mixed snapshots. Provider and service counts are not interchangeable, and undated displays should not become historical facts.

The response-time panel displays averages ranging from 211 ms for property search to 4,454 ms for RC search, with credit score at 2,397 ms. Sampling methodology is not provided; TPS averages cannot safely be converted into monthly request totals. [S02]

Visual assets and capture record

Screenshots preserve the interface and layout. Original artwork preserves the site's visual vocabulary. The manifests tie each saved file back to its source page or asset URL.

Captured view	Pixels / format	Portfolio use
whats-new-full	1348 x 2253 JPEG	Full-page archival view
overview-full	1348 x 10135 JPEG	Full-page archival view
how-it-works	1348 x 926 JPEG	Readable product / content detail
dashboard-august-2026	1348 x 926 JPEG	Readable product / content detail
services-income	1348 x 926 JPEG	Readable product / content detail
docs-land-records-overview	1348 x 3378 JPEG	Readable product / content detail
docs-land-records-async-pipeline	1348 x 926 JPEG	Readable product / content detail
docs-land-records-state-providers	1348 x 3889 JPEG	Readable product / content detail

Selected views from the capture record. The companion manifest provides the complete screenshot inventory, original image URLs and source-page relationships; file names alone do not establish provenance.

HOW TO USE THE MEDIA

Use readable detail views for explanations of a specific card or workflow; full-page images for archival completeness; hero / platform views for an opening context frame. Captions should name RBIH and the capture date. Retain the original, uncropped version alongside any portfolio crop.

SHORT VIDEOS

The companion short videos present captured public content using crops, movement and captions. They are visual summaries of the archived material, not recordings of a live lender application, real borrower loan, API call or consent transaction.

The complete file listing and source-URL mapping are in the companion archive. This page summarizes a selection of screenshots at build time; the original source manifest is the full catalog. Artwork and logos remain original-source material.

Turn context into a case study

This archive supplies external context. A strong portfolio needs an additional evidence layer showing what Priyam personally decided, shipped and measured.

Claim a portfolio may make	What this archive supports	Project evidence still needed
“Built a lending / risk integration in the ULI ecosystem.”	The external ULI proposition, provider categories and documented service patterns.	Project, role, dates, counterparties, shipped interface and release evidence.
“Designed consent and data retrieval.”	AA / dairy public patterns and a documented async land-data service.	Actual selected service, user journey, contract mapping, edge cases and acceptance evidence.
“Supported agricultural credit decisions.”	Land, dairy, SHG and KCC-related published capabilities.	Which signals were delivered, how the lender used them and who owned the decision.
“Improved turnaround, conversion or risk.”	The site's intended benefits and ecosystem context.	Metric definition, baseline, period, cohort, results and attribution.
“Owned a platform at ecosystem scale.”	Only official ecosystem counts and relationships.	Decision rights, owned component, team / stakeholder scope and the actual product's scale.

CASE-STUDY STRUCTURE

Problem: the specific lender or farmer friction. **Scope:** the component owned and decision rights. **Approach:** alternatives, data contracts, consent and failure handling. **Delivery:** which product / services went live. **Outcome:** a measured change with its time window. **Context:** use the ULI sources to explain the surrounding public infrastructure.

READY TO ATTACH

Pair this pack with redacted PRDs, integration diagrams, release notes, partner confirmations and metric screenshots. The record can then separate Priyam's contribution from RBIH's platform and other providers' products.

For now, the defensible caption is: “Official ULI ecosystem reference preserved for my lending-platform portfolio.” Personal authorship or operational outcomes are intentionally left to project-owned evidence.
